Fertility preservation involves freezing eggs, sperm or reproductive tissue for later use. Ovarian suppression with medicines like Lupron is another option. The preservation of male fertility is carried out by freezing sperm. However, there is another experimental technique, the freezing of testicular tissue, although it is not yet in practice. In any case, the seminal quality of men who are going to undergo cancer treatment may be altered. For this reason, it is important for them to know how they can preserve their fertility. In this way, men will have the possibility of becoming parents once the cancer is over. Each of the options for preserving male fertility is detailed below. We're already SEGUIDORES!
